

FCT::DynamicMesh::draw

FCT::StaticMesh::draw

FCT::RHI::CommandBuffer  
::drawIndex

```
graph LR; A[FCT::DynamicMesh::draw] --> C[FCT::RHI::CommandBuffer::drawIndex]; B[FCT::StaticMesh::draw] --> C;
```

The diagram illustrates a call flow where two different mesh types, DynamicMesh and StaticMesh, both utilize the same underlying RHI CommandBuffer for drawing. The left side shows two separate function calls: FCT::DynamicMesh::draw and FCT::StaticMesh::draw. Arrows from both of these functions point to a single, larger box on the right, which represents the common target: FCT::RHI::CommandBuffer::drawIndex. This target box is shaded gray, while the source boxes are white.
